## "Fantastic 5"

The new Alpine PDX 5-channel amplifier can serve a complete system

Attractive, sophisticated, compact – this new Alpine **PDX 5** channel amplifier certainly deserves its name: **Fantastic 5**. The new **PDX-5** amplifier is the first 5-channel unit in the series and easily has the capacity to serve a medium-size car hifi system with four loudspeakers and a powerful subwoofer – all by itself. The ratings for this talented "solo performer" are 4x75W (RMS) plus 1x300W (RMS). The amplifier, measuring a mere 257x192 mm in accordance with standard **PDX** dimensions, develops a maximum of 1200W.

The **PDX amplifier** not only looks good: it can be used for a wide range of applications and even fits into small-size mounting slots.

State-of-the-art digital technology holds the key to the **PDX 5** amplifier, which boasts an attenuation factor an incredible 350% higher than in standard Class A/B amps. The digital switch mode system ensures that the unit stays nice and cool even when the beat is at its hottest!

The low buildup of heat even at continuous full capacity – a particularly important feature in subwoofer mode – does away with the need for large-scale cooling surfaces.

Other highlights of the **PDX 5** amplifier include the attractive and easily accessible connection terminals, all arrayed on one side. Installation is therefore much more straightforward compared with other amplifiers. There is also easy access for all the necessary filter settings on the rear of the unit.

The PDX 5 amplifier rounds off the Alpine PDX range, confirming Alpine's outstanding reputation as a provider of powerful, compact amplifier units.
